

ABSTRACT

Disclosed are a system and a method for automatically configuring client devices. A client device queries a user whether the user has an existing service provider. If the user does not have the existing service provider, the client device provides the user with a list of service providers. If the user specifies a service provider or the user selects a service provider from the list of service providers, the client device queries the user for user's information data and formats the user's information data into a predetermined data structure and data format. Further, the client device connects to the service provider selected by the user and sends the formatted user's information data to the service provider. Upon a reception of the user's information data from the client device, the service provider provides configuration data to the client device. Further, the client device uses the configuration data to configure a plurality of applications and enables the user of the client device to establish future communication sessions with the service provider selected by the user by providing the user login information data.
